

Rain on Hay Protection

Cut hay is vulnerable to significant quality losses from rain in the days following cutting. Protect the value of your hay crop with WeatherBill Rain on Hay Protection.

Producing multiple good cuttings of hay each season requires smart timing and good weather. Rain between cutting and baling can cause hay to lose color and protein content as well as encourage mold. Premium Alfalfa is quickly reduced to feeder quality hay.

For the first time you can reduce the risk posed by rain on cut hay, with WeatherBill Rain on Hay Protection. You choose the dates of coverage (when your cut hay is vulnerable), and how much you'd like to receive for each rain event. The heavier or more frequent the rainfall, the higher the payout.

Rain on Hay Protection can be purchased as little as five days before cutting is scheduled to begin, when you know your harvesting schedule. You choose how many acres to protect and how much you want to get paid per acre.

With Rain on Hay Protection, there is no claims process or proof-of-loss required. Payout is automatic if you experience untimely rain, compensating you immediately.
